

THE paper case: TAS2R bitter-receptor cluster, chr12:10.80 - 11.10 Mb (T2T-CHM13)

The bubble at 10.95-10.98 Mb is an HG01960-specific insertion relative to CHM13. EUR
 HG01960's AFR haplotype does NOT align to any of the 46 panel haplotypes here (no SNPs to read).

RFMix and FLARE default to EUR for 9/10 chimeras. Bubble-aware impop_k correctly calls AFR from the flanking pangenome identity signal.
